

HisabDo App (User Research & Feedback Report)

Prepared by: Areeba Sharif

1. Overview

As part of Day 14 of the internship capstone project, the HisabDo mobile application was installed and evaluated through hands-on testing and feedback collected from 5 real users. This report summarizes the exploration process, user feedback, issues discovered, and improvement suggestions.

2. Features Tested

- Dashboard & Quick Actions navigation
- Add Receivable / Add Payable transaction flow
- Customer creation
- Reports section (charts, month-wise summary, transaction list)
- Analytics (Receivable vs Payable breakdown, Annual Trend, Avg Daily metrics)
- Calculator suite: Basic Calculator, Percentage, Discount, Profit Margin
- Voice Entry (speech-to-transaction)
- **PDF export:** Financial Summary Report and Invoice generation
- Account/login requirement (or lack thereof)

3. User Feedback (5 Test Users)

The app was handed to 5 real users, who were asked to add a transaction on their own and then share their impressions. Feedback was consistently positive regarding usability:

User	Feedback
Test User 1	App is easy to use; found the buttons intuitive.
Test User 2	Navigation felt clear and simple to follow.
Test User 3	Liked that each button clearly states what it does.
Test User 4	Overall user-friendly experience, no major confusion.
Test User 5	Easy to use, but had trouble with the Voice Entry feature specifically.

Common theme: All 5 users found the app easy to use, well organized, and clear about what each button does. The main issue mentioned by all users was the **Voice Entry** feature. This also matches the problems found during our own testing.

4. What Worked Well

- Add Receivable / Payable flow is clear, with sensible defaults (date/time auto-filled, default category, optional note).
- Dashboard updates correctly and immediately after a transaction is added.
- Reports section math is accurate (totals, net balance, and transaction list all match entered data).
- All four calculator tools (Calculator, Percentage, Discount, Profit Margin) produced mathematically correct results.
- Invoice PDF generation calculates totals correctly (Receivable, Payable, Balance, Total all verified accurate).
- Core app is usable without creating an account — no signup barrier for adding transactions, viewing reports, or exporting PDFs.

5. Issues Discovered

No.	Issue
1	Voice Entry misparses spoken input: a plain number (e.g. “500”) gets duplicated into the Customer field, the Type is auto-set to “Expense” without confirmation, and the app still shows “Could not detect income or expense” despite already guessing a type.
2	Voice Entry produces the same faulty behavior on a second, unrelated test phrase (“add it in”) confirming this is a reproducible bug, not a one-off glitch.
3	Bad data from Voice Entry testing (a customer literally named “500”) carried over into a real generated Invoice PDF, showing how one bug can pollute other parts of the app.
4	Financial Summary PDF export has a data-mapping bug: the Receivable field showed the Net Balance value instead of the actual receivable total, and Payable incorrectly showed 0 even though a payable entry existed.
5	Inconsistent behavior between PDF types: the Invoice PDF calculated Receivable/Payable correctly, while the Financial Summary PDF did not, for the same underlying data.
6	Analytics “Avg Daily Receivable/Payable” currently shows the same value as the total — unclear whether per-day averaging is actually implemented, since all test data was entered on a single day.
7	No account or login system: this means no backup, no cross-device sync, and no protection (PIN/biometric) if the phone is lost, stolen, or the app is uninstalled — a notable risk for an app tracking real financial data.
8	Expense (a Quick Action on the dashboard) and Payable (an Add Transaction option) are separate concepts in the UI, but it's unclear to a new user where a regular expense should be logged versus a payable.

6. Improvement Suggestions

- Fix Voice Entry parsing: validate detected amount/type before saving, and never write numeric input into the Customer field.

- Fix the Financial Summary PDF so Receivable and Payable fields reflect actual entered totals, consistent with the Invoice PDF and in-app Reports.
- Add optional account-based backup and/or local PIN or biometric lock to protect financial data.
- Verify and, if needed, fix the “Avg Daily” analytics calculation across multiple days of data.
- Clarify the distinction between “Expense” and “Payable” in the UI, e.g. with short inline descriptions.

7. Conclusion

HisabDo is an easy-to-use app for managing expenses and khata records. All 5 users gave positive feedback about its usability and navigation. The main features, including transactions, reports, calculators, and invoice generation, worked well. The main issues found were the **Voice Entry bugs**, the **Financial Summary PDF data-mapping issue**, and the **lack of account-based backup and security**. These issues should be addressed to make the app more reliable and secure.

8. Supporting Evidence

Screenshots documenting each finding above (dashboard, add transaction flow, reports, calculators, Voice Entry bugs, PDF exports, and analytics) are included separately in the GitHub submission for this task.
